# **Emergent Phenomena at High Energies**

Peter Z Skands — Royal Society Wolfson Visiting Fellow — U of Oxford & Monash U

Australian Government

Australian Research Council

G. H. Lewes: "the emergent is unlike its components insofar as ... it cannot be **reduced** to their **sum** or their difference." English Philosopher; coined the term "emergence" in "Problems of Life and Mind", 1875

In Quantum Field Theory:

"Components" ~ Elementary interactions — encoded in  $\mathscr{L}$ 

"Sums" ~ Perturbative expansions ~ combinations of elementary interactions

What else is there? Structure beyond (fixed-order) perturbative expansions: **<u>Fractal scaling</u>**, of jets within jets within jets ... & loops within loops within loops ...

a line a

<u>Confinement (in QCD)</u>, of coloured partons within hadrons

#### The Goal

### Use measurements to test hypotheses about Nature

# Problem 1: no exact solutions to QFT → Perturbative Approximations

New techniques

→ New insights into perturbation theory at non-trivial orders

new applications

Jets within jets within jets Loops within loops within loops

Plan

# The Goal

### Use measurements to test hypotheses about Nature

# Problem 1: no exact solutions to QFT → Perturbative Approximations

#### New techniques

→ New insights into perturbation theory at non-trivial orders

→ new applications

Jets within jets within jets Loops within loops within loops

#### **Problem 2:** We collide — and observe – hadrons

Plan

Strongly Bound States — Non-Perturbative

# The Goal

### Use measurements to test hypotheses about Nature

# Problem 1: no exact solutions to QFT → Perturbative Approximations

#### New techniques

→ New insights into perturbation theory at non-trivial orders

new applications

Jets within jets within jets Loops within loops within loops

#### **Problem 2:** We collide — and observe – hadrons

Plan

New measurements challenge conventional paradigms

study confinement beyond static limit

Strongly Bound States — Non-Perturbative

## **Ulterior Motives for Studying QCD**

$$J = -\frac{1}{4} F_{\mu\nu} F^{\mu\nu}$$

$$+ i \overline{\psi} \overline{\psi} \psi + h.c.$$

$$+ \overline{\psi} i \overline{\psi} i \overline{\psi} \psi + h.c.$$

$$+ \overline{\psi} i \overline{\psi} i \overline{\psi} - h.c.$$

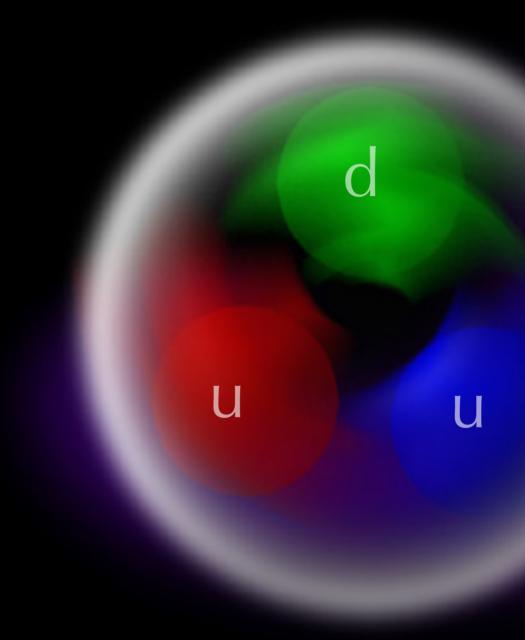

LHC: 90% of data still to come

→ higher sensitivity to smaller signals.

High statistics ↔ high accuracy

### **Consider a hadron; why is it complicated?**

#### Popular science: Three quarks for muster mark

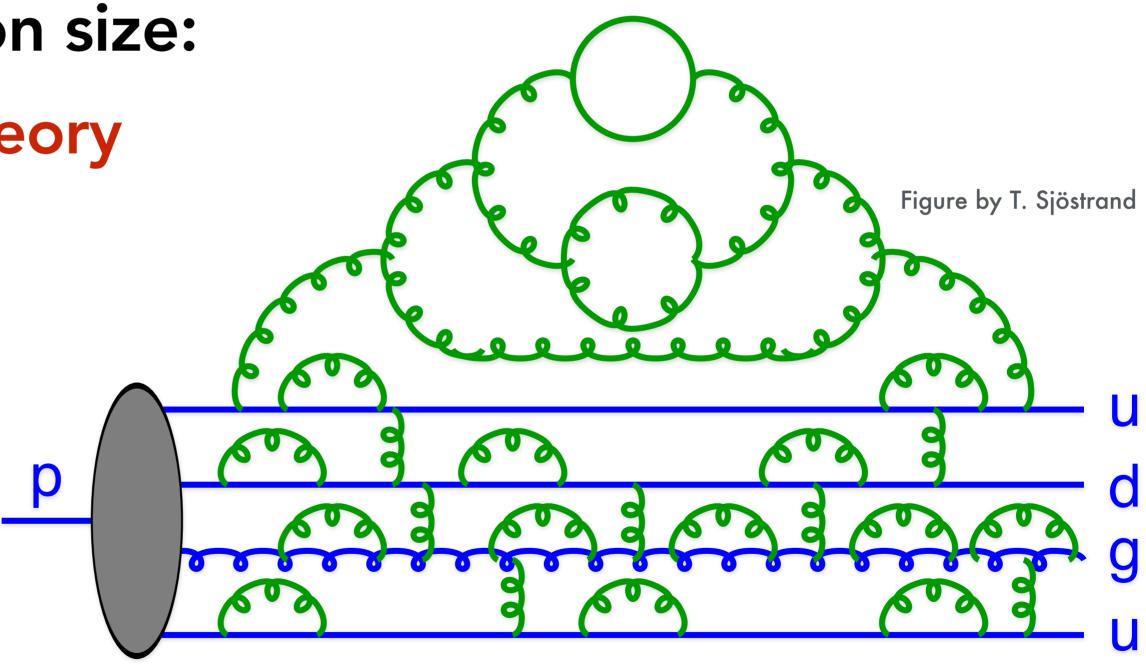

#### Undergraduates: Quark-Model wave functions

### **Real-Life Hadrons**

Strongly bound states of quarks and gluons With a complicated time-dependent structure

For wavelengths  $\gtrsim$  proton size: Can't do perturbation theory

### To the Rescue: Asymptotic Freedom

### **Over short distances** $\ll$ **proton radius**:

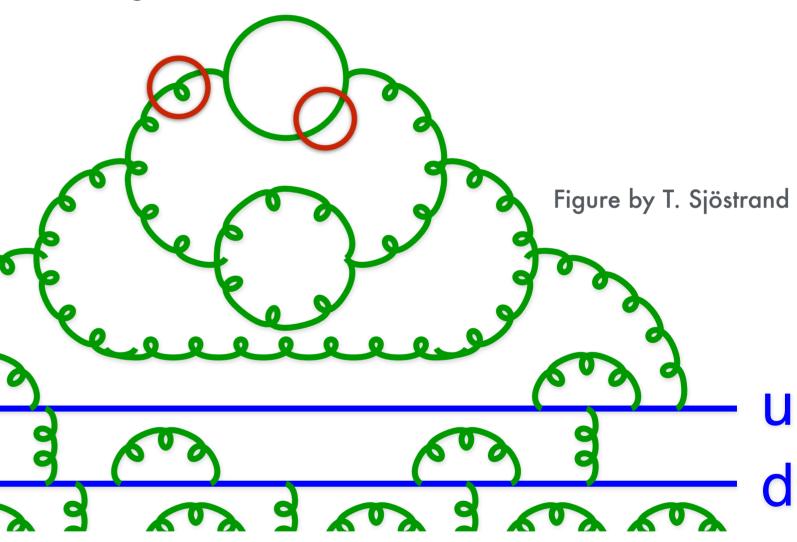

Quarks and gluons do behave like approximately free particles ~ plane waves -> can do perturbation theory

**Parametrise** nonpeturbative "mess" in terms of probability densities for each type of plane wave  $(g, d, d, u, \bar{u}, s, \bar{s}, ...)$ :

**Parton Distribution Functions** (universal and measurable)

### **Mathematically expressed via a Factorization Theorem**

(Example of factorization of short- and long-distance physics)

#### Part 1: Perturbative Aspects

Separation of scales

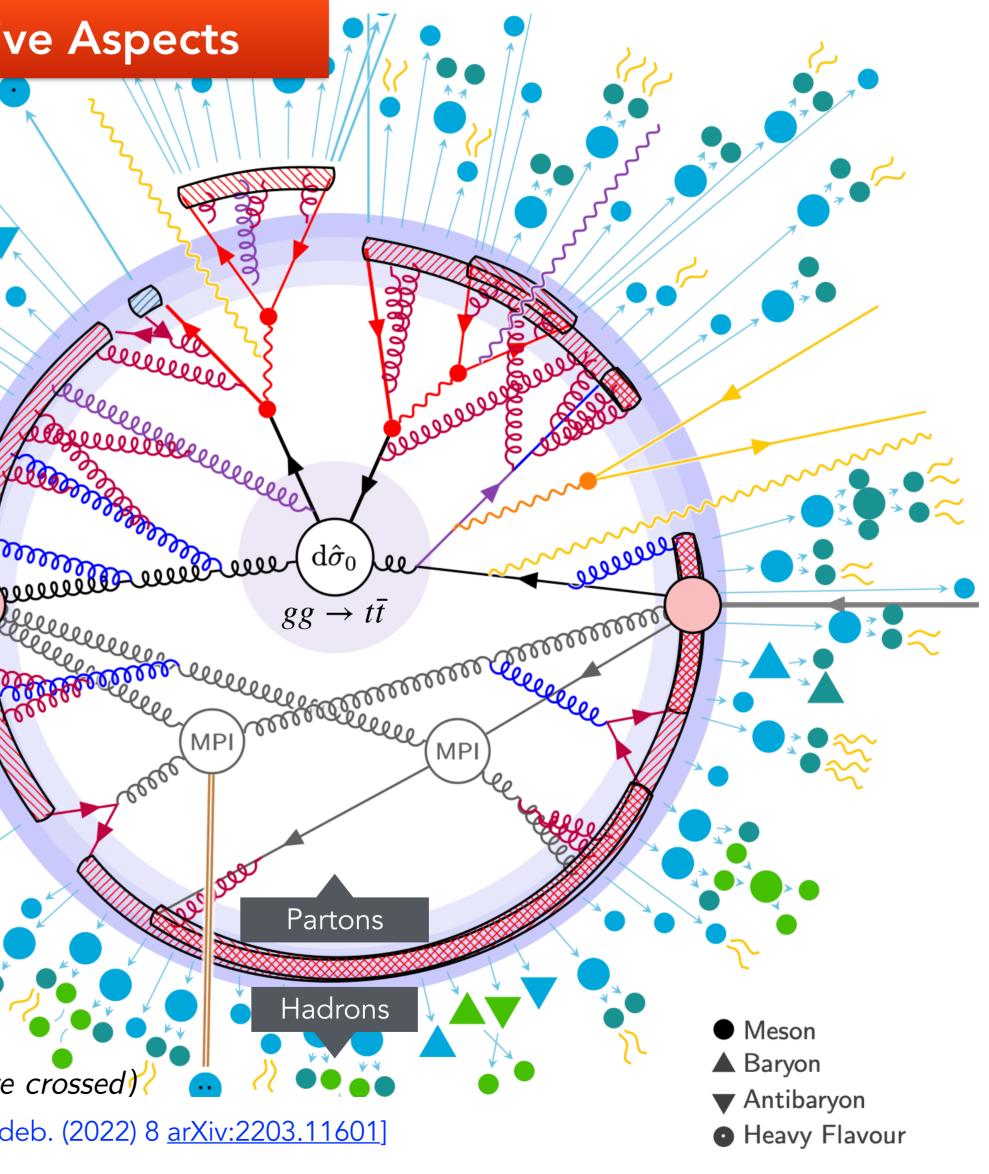

Factorizations

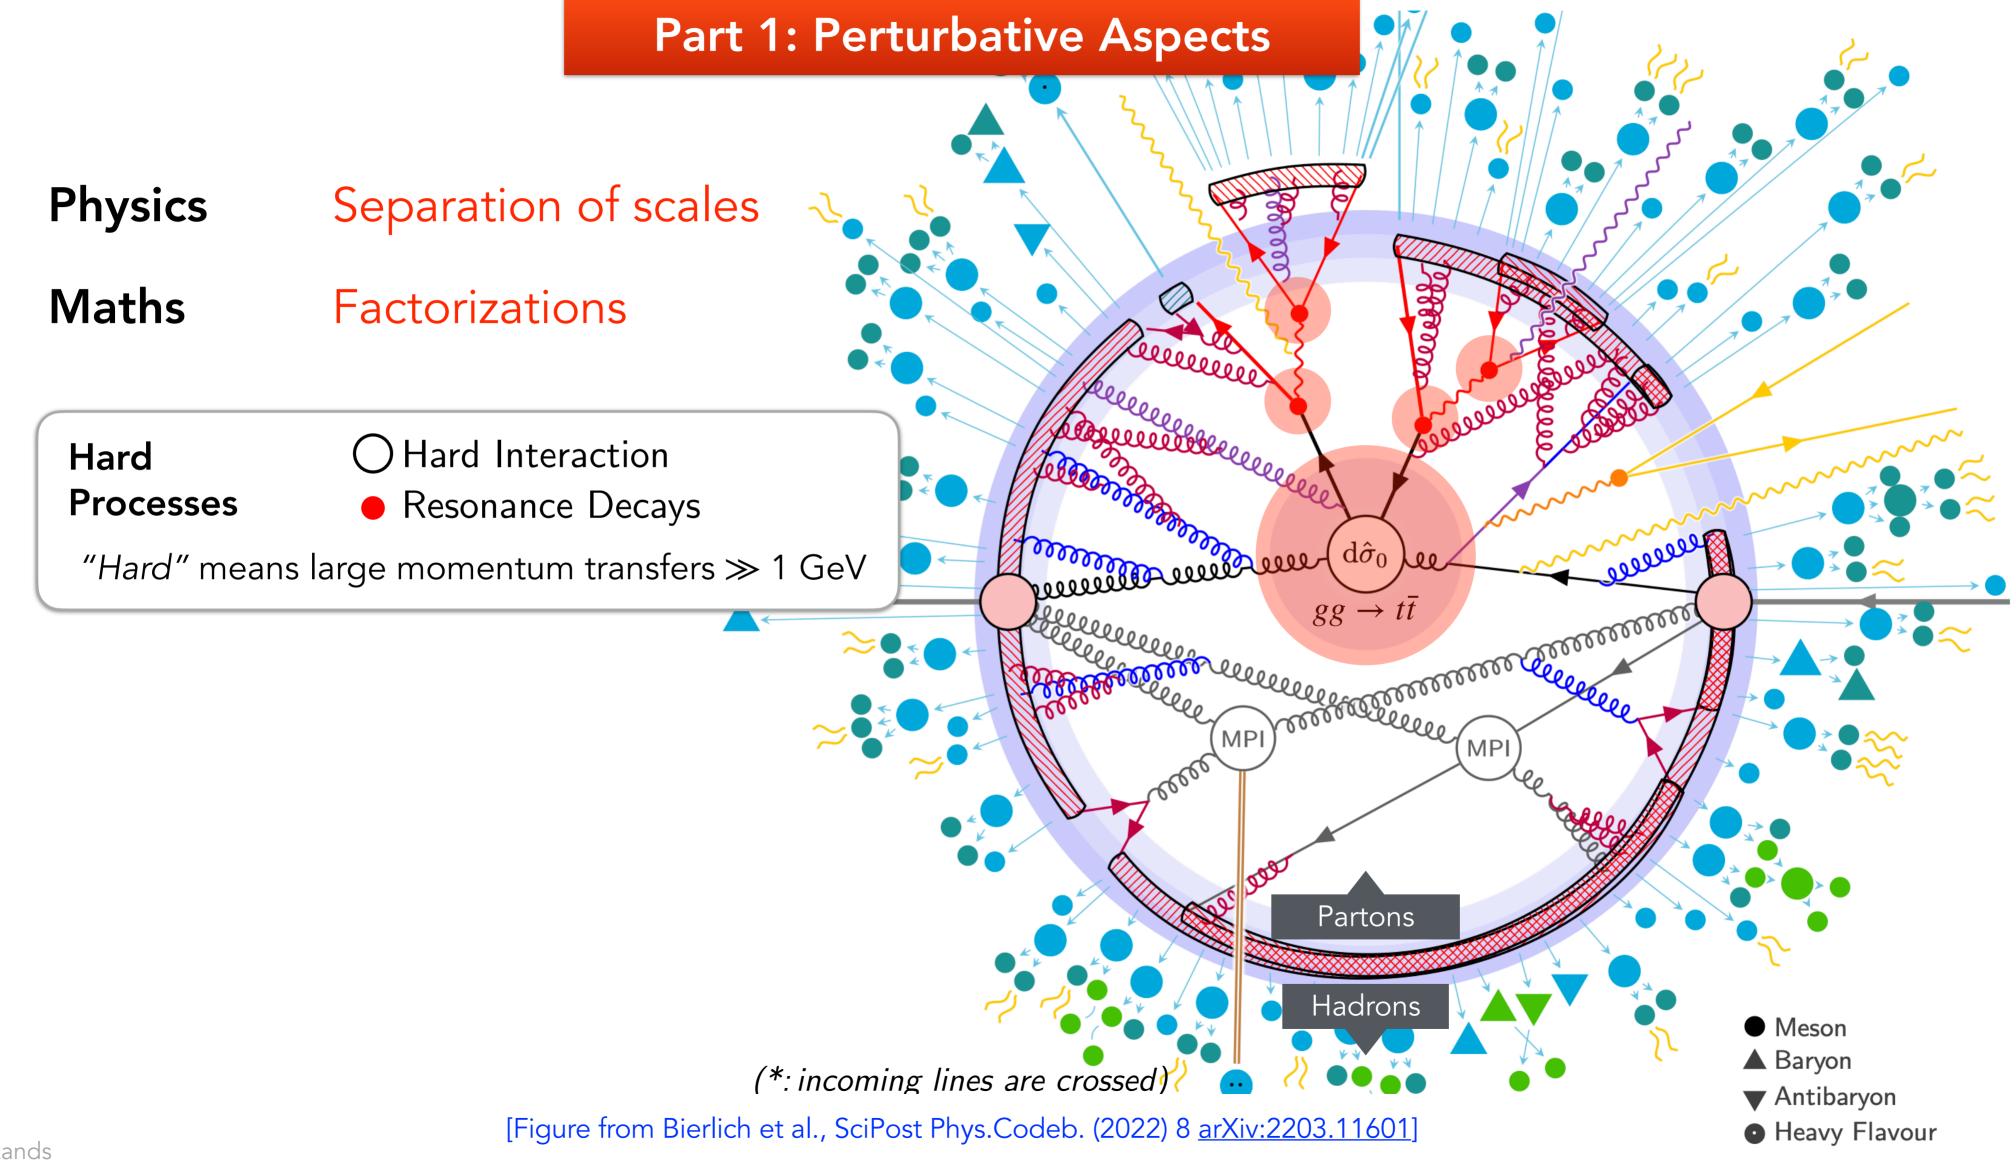

Maths

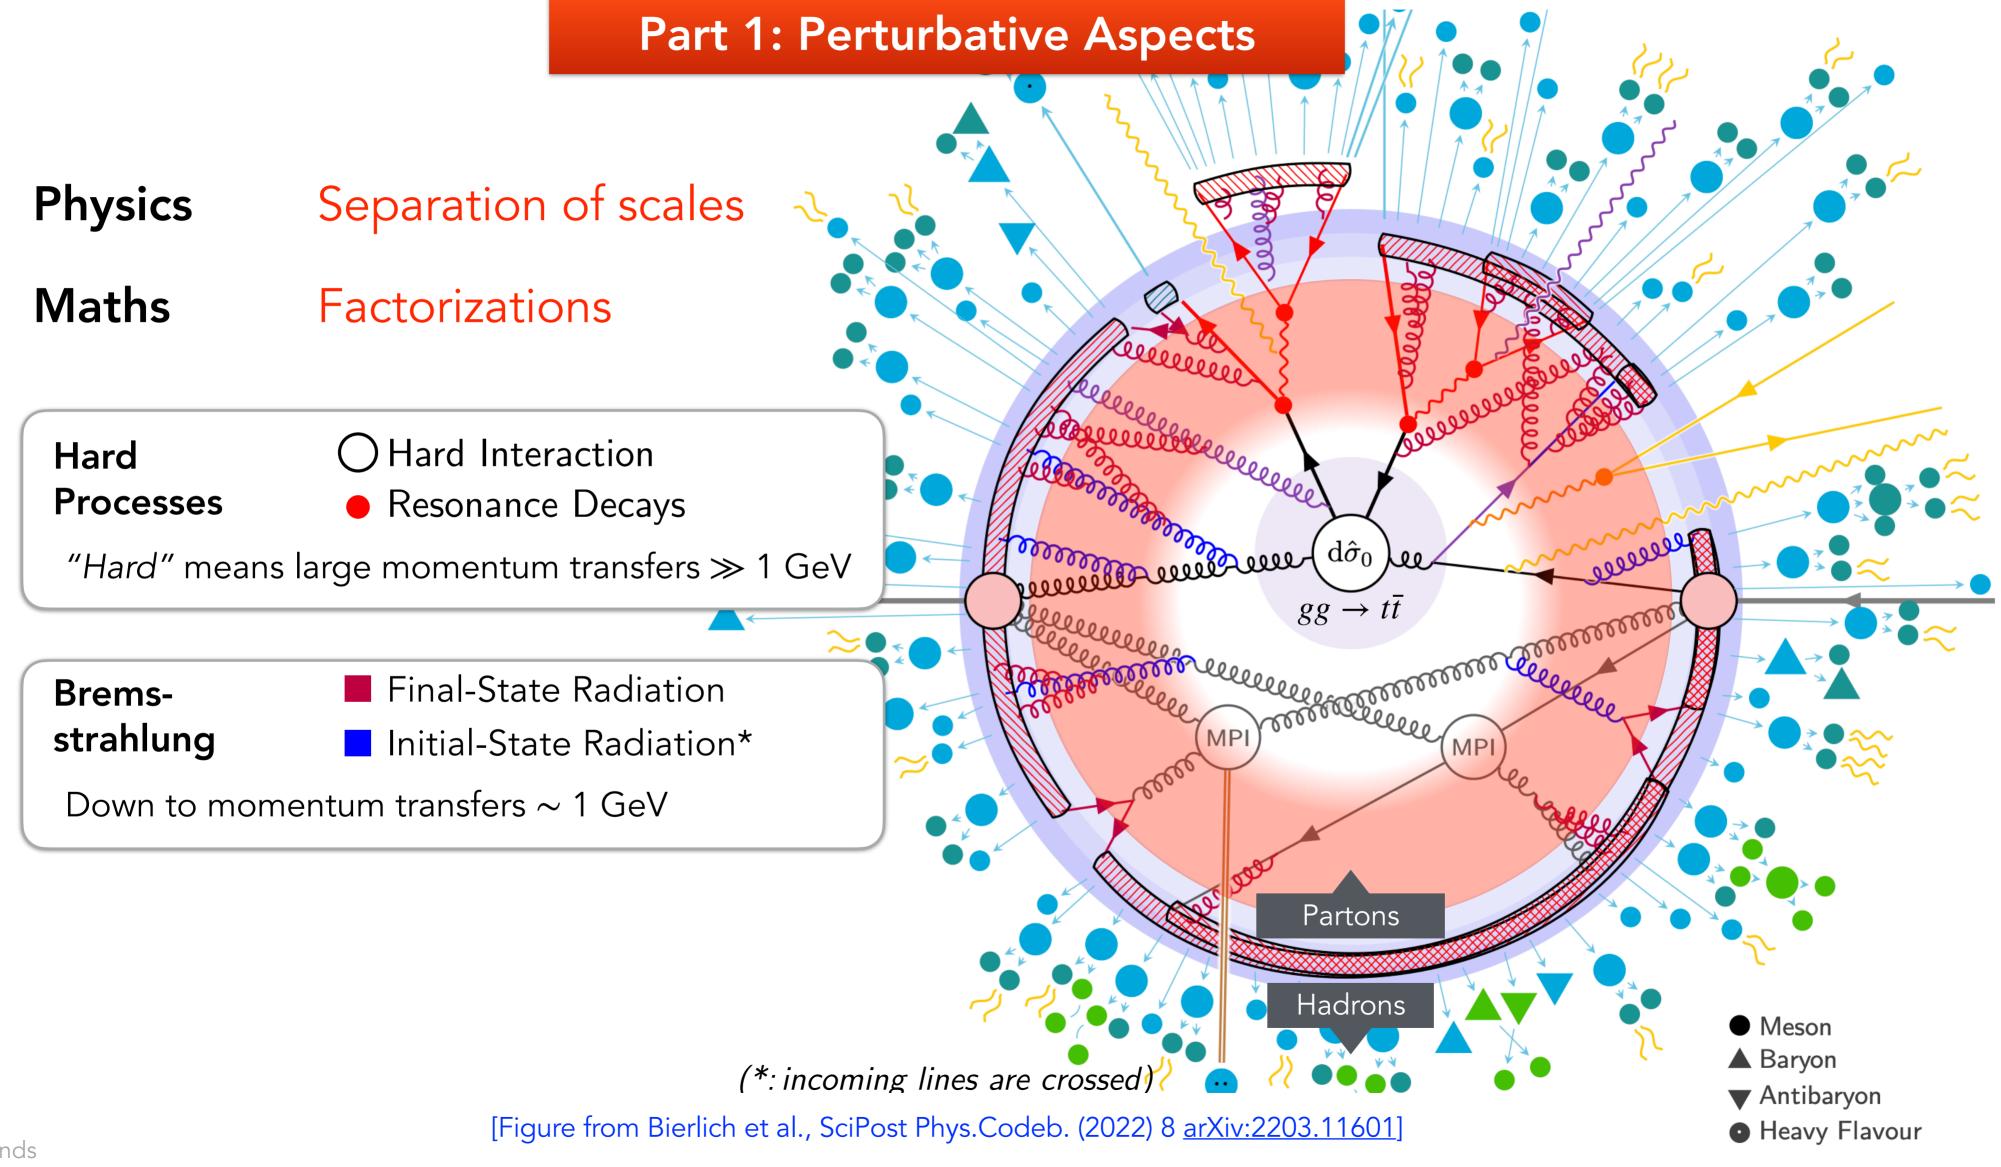

**Physics** 

(\*: incoming lines are crossed)?

Peter Skands

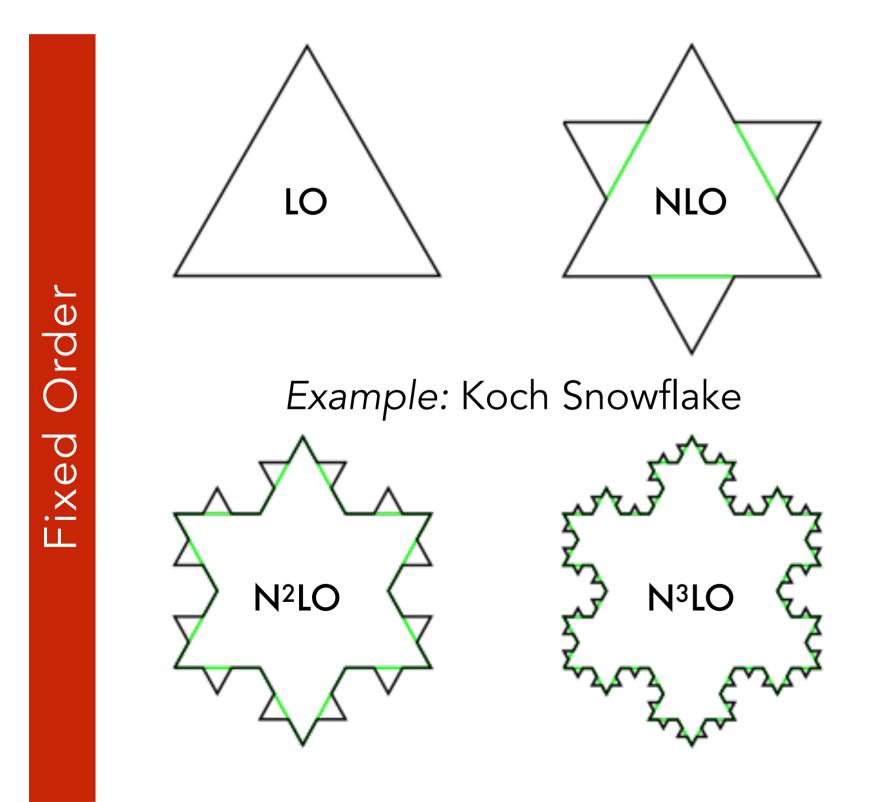

### Perturbative Approaches

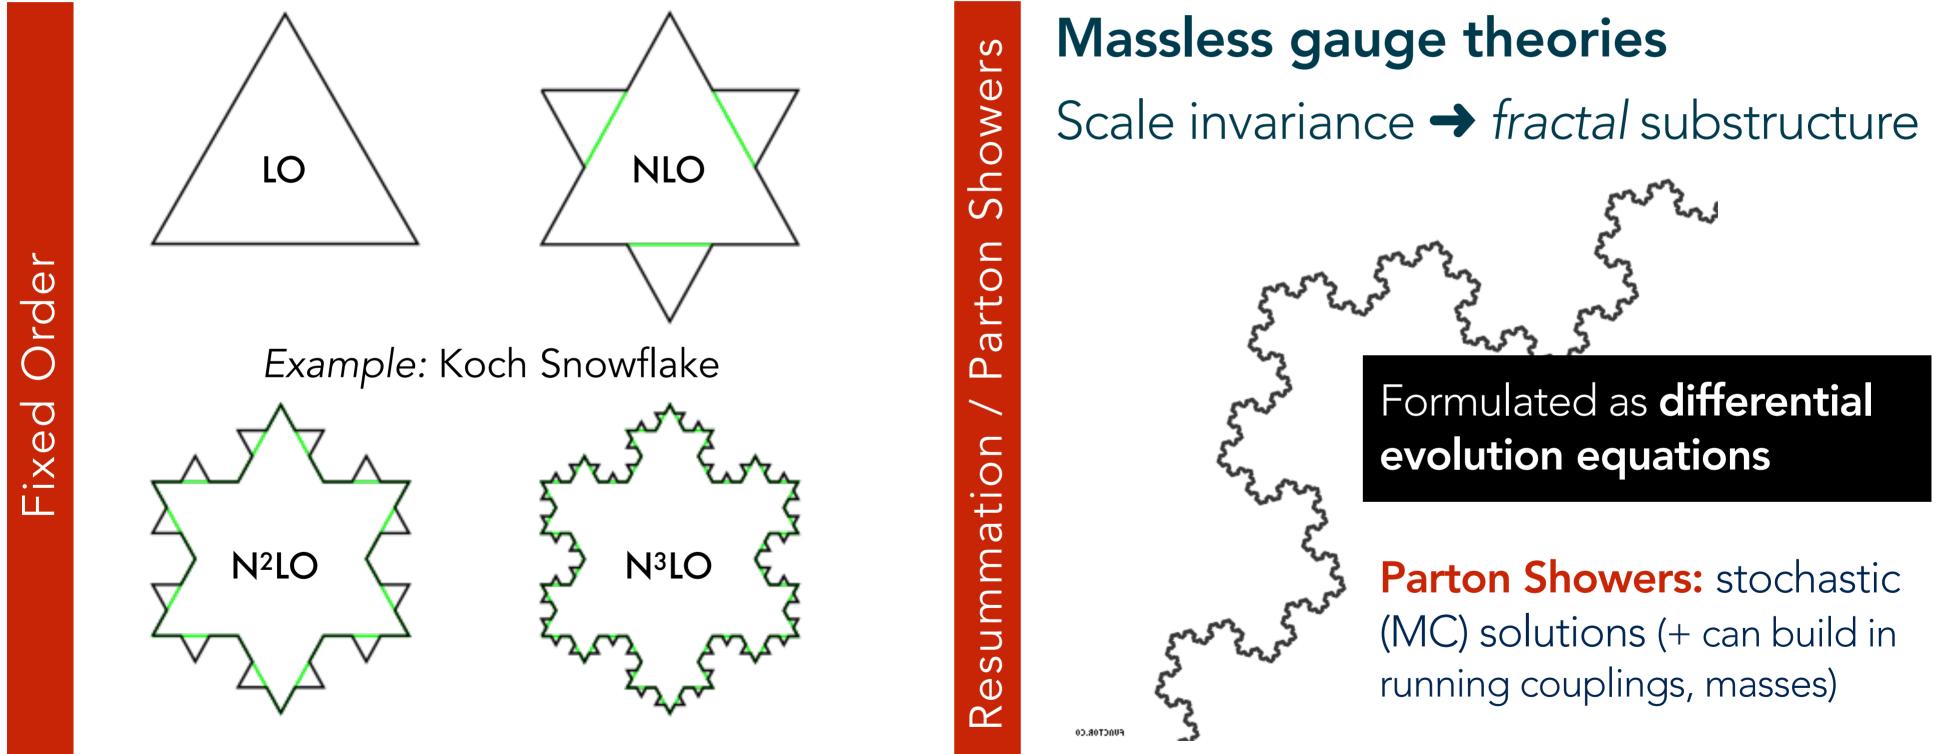

## P.T. ~ Calculate the area of a shape (d $\sigma$ ) with higher and higher detail Difference from exact area $\propto \alpha^{n+1}$

Note: (over)simplified analogy, mainly for IR structure. More at each order than shown here.

### Perturbative Approaches

## P.T. ~ Calculate the area of a shape ( $d\sigma$ ) with higher and higher detail Difference from exact area $\propto \alpha^{n+1}$

**Note:** (over)simplified analogy, mainly for IR structure. More at each order than shown here.

#### **Fractal Schmactal**

### Parton Showers -> Explicit representation of the fractal structure - great!

Needed approximations to get there:

- "Leading Logarithm", "Leading Colour", ... ► Off-the-shelf parton showers only good to at best ~ 10%

# I thought LHC physics was supposed to be high-precision stuff? What good is Peta-Bytes of data if we can only calculate to $\sim 10\%$ ?

#### **Precision Frontiers**

### **Shower Accuracy**

- Higher-order corrections within the showers themselves
  - Oxford: **PanScales** with "NLL-accurate" recoils → NNLL; that's why I'm on sabbatical there Monash: Vincia:  $2^{nd}$ -order shower kernels, new "direct"  $2 \rightarrow 4$  branchings, iterated MECs
- - + Many other efforts:

e.g., Angular Ordering (Herwig); Alaric (Sherpa); Deductor; Apollo/Artemis; ...

## Matching & Merging @ NNLO

Combine fixed orders and showers **MINNLOPS** based on PowHeg  $\oplus$  analytical resummation  $\oplus$  NNLO normalization  $\otimes$  (LL) showers **GenEva** NNLO-matched resummations  $\oplus$  truncated (LL) showers **VinciaNNLO** - based on a new type of showers  $\otimes$  second-order corrections

### Why go beyond Fixed-Order perturbation theory?

#### Schematic example:

- For an arbitrary "hard process"
- ("hard" means involving a large momentum transfer  $Q_{hard} \gg 1 \text{ GeV}$ )
- Calculation of the fraction of events that pass a bremsstrahlung veto
  - (i.e., **no additional jets** with momentum transfers >  $Q_{\text{veto}}$ ):

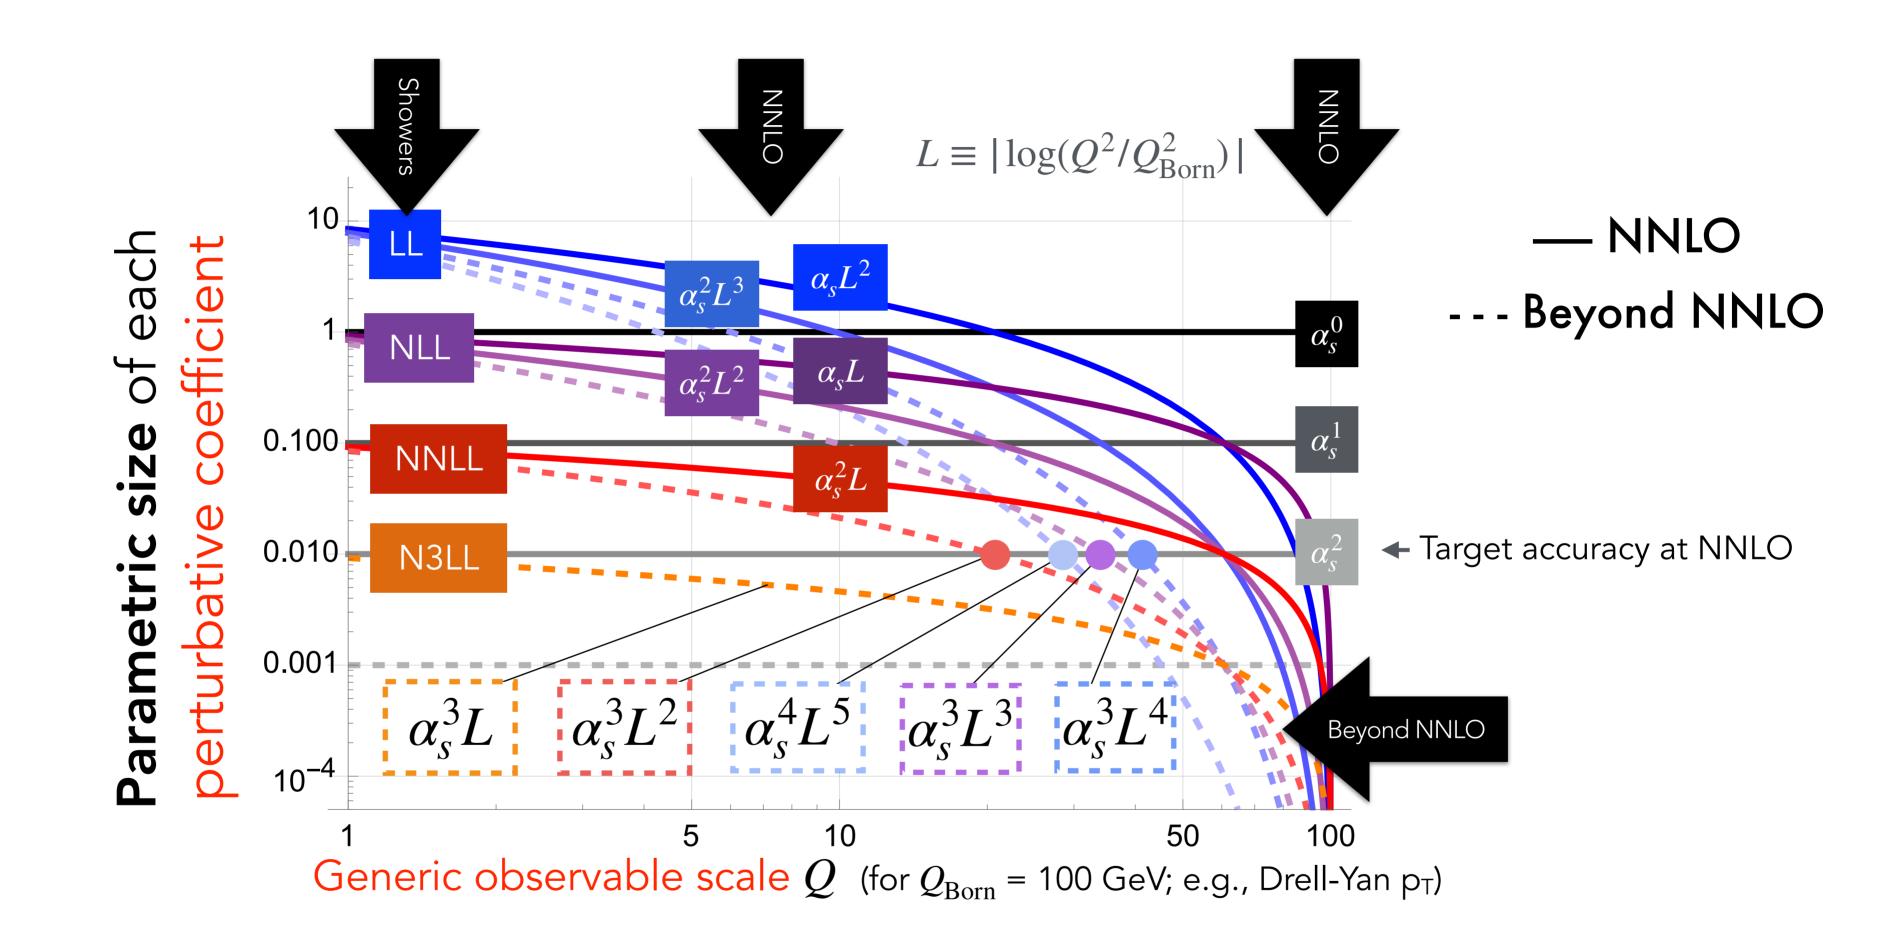

$$\frac{10}{1} - \alpha_s(L^2 + L + F_1) + \alpha_s^2(L^4 + F_1)$$

 $L \propto \ln(Q_{\rm veto}^2 / Q_{\rm hard}^2)$ 

 $\left(\text{Logs arise from integrals over propagators } \propto \frac{1}{a^2}\right)$ 

 $\underbrace{\text{NNLO}}_{+L^3 + L^2 + L + F_2} + \dots$ 

### The Case for Embedding Fixed-Order Calculations within Showers

Bremsstrahlung Resummations (Showers) extend domain of validity of perturbative calculations

### The Case for Embedding Fixed-Order Calculations within Showers

%-level precision @ LHC  $\Rightarrow$  NNLO + NNLL

#### L Targeted by several groups

Not quite there (yet) — but close ...

## **Our Approach: Sector Showers**

#### Divide the *n*-gluon phase space up:

#### *n* non-overlapping sectors

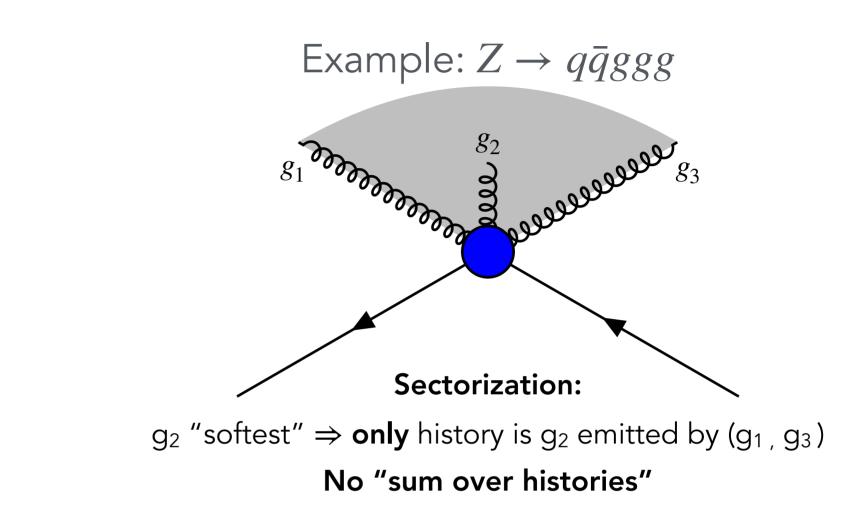

- Inside each: use only a single evolution kernel (the most singular ~"classical" one)
- Based on "Ariadne  $p_{\perp j}^2$ " =  $\frac{s_{ij}s_{jk}}{s_{iik}}$  with  $s_{ij} \equiv 2(p_i \cdot p_j)$

→ Unique properties (which turn out to be useful for matching): Unambiguous scale definitions Shower operator is **bijective** & true Markov chain

- Achieves LL with a single history (instead of factorial number)
- (Generalisations to  $g \rightarrow q\bar{q}$  and multiple Borns  $\implies$  sums)

#### Work in progress on NLL and beyond (with new Monash post docs L. Scyboz & B. El Menoufi)

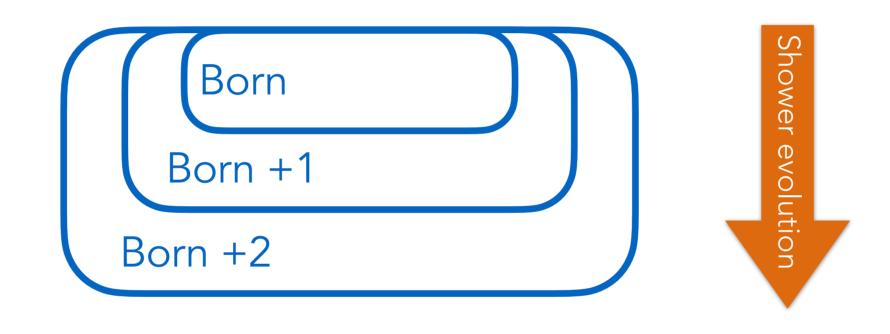

Lopez-Villarejo & PZS 2011 Brooks, Preuss, PZS 2020

## **NNLO** Matching with Sector Showers

#### Idea: Use (nested) Shower Markov Chain as NNLO Phase-Space Generator

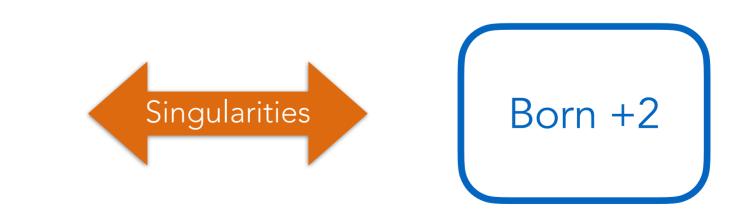

Harnesses the power of showers as efficient phase-space generators for QCD **Efficient:** Pre-weighted with the (leading) QCD singular structures = soft/collinear poles

**Different from conventional Fixed-Order phase-space generation** (eg VEGAS)

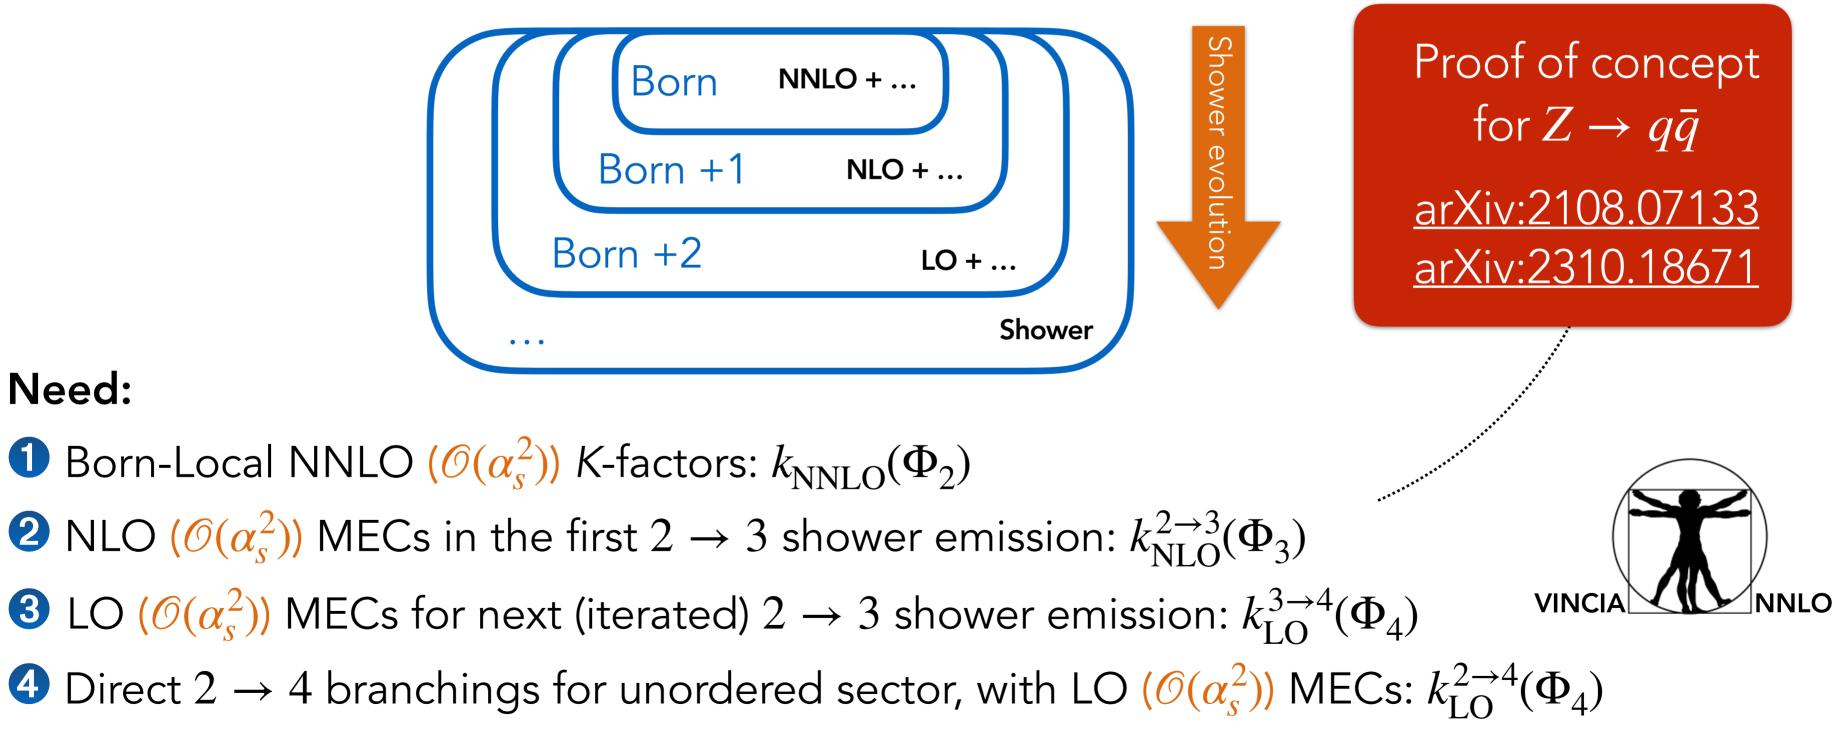

Peter Skands

## **NNLO** Matching with Sector Showers

#### **Continue parton-shower evolution afterwards**

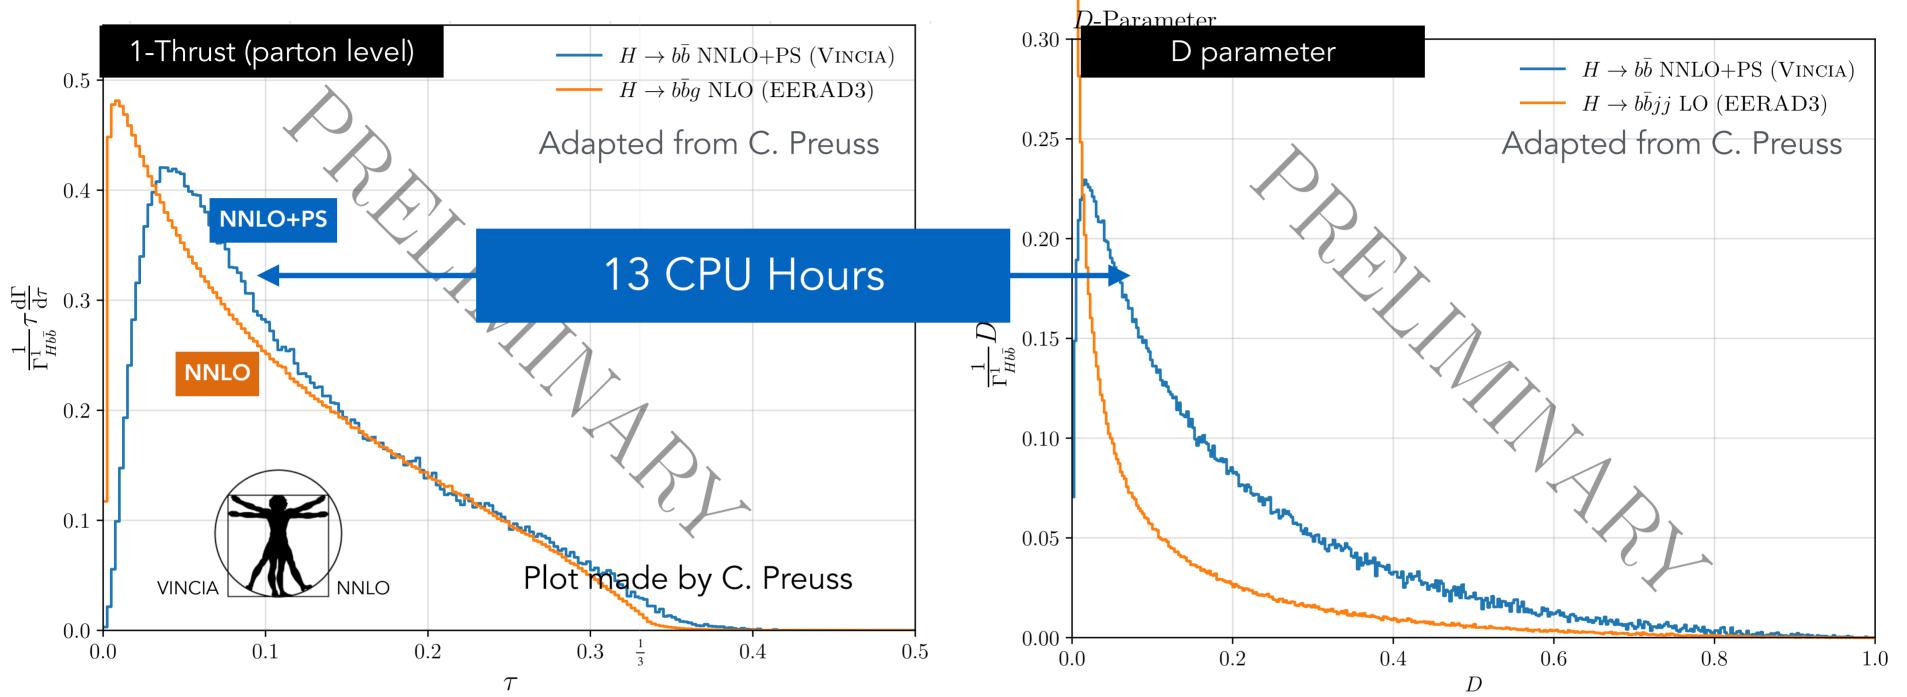

- No auxiliary / unphysical scales  $\Rightarrow$  expect small matching systematics
  - (+ generalises to N3LO?)

#### Need:

- **1** Born-Local NNLO ( $\mathcal{O}(\alpha_s^2)$ ) K-factors:  $k_{\text{NNLO}}(\Phi_2)$
- 2 NLO ( $\mathcal{O}(\alpha_s^2)$ ) MECs in the first  $2 \rightarrow 3$  shower emission:  $k_{\rm NLO}^{2\rightarrow 3}(\Phi_3)$
- **3** LO ( $\mathcal{O}(\alpha_s^2)$ ) MECs for next (iterated)  $2 \rightarrow 3$  shower emission:  $k_{\rm LO}^{3\rightarrow 4}(\Phi_4)$

#### **Preview:** VinciaNNLO for $H \rightarrow bb$

VINCIA NNLO+PS: shower as phase-space generator: efficient & no negative weights! Looks ~ 5 x faster than EERAD3\* (for equivalent unweighted stats) **#Fermilab** 

+ is matched to shower + can be hadronized

Proof of concepts now done for  $Z/H \rightarrow q\bar{q}$ ; work remains for pp (& for N<sup>n</sup>LL accuracy)

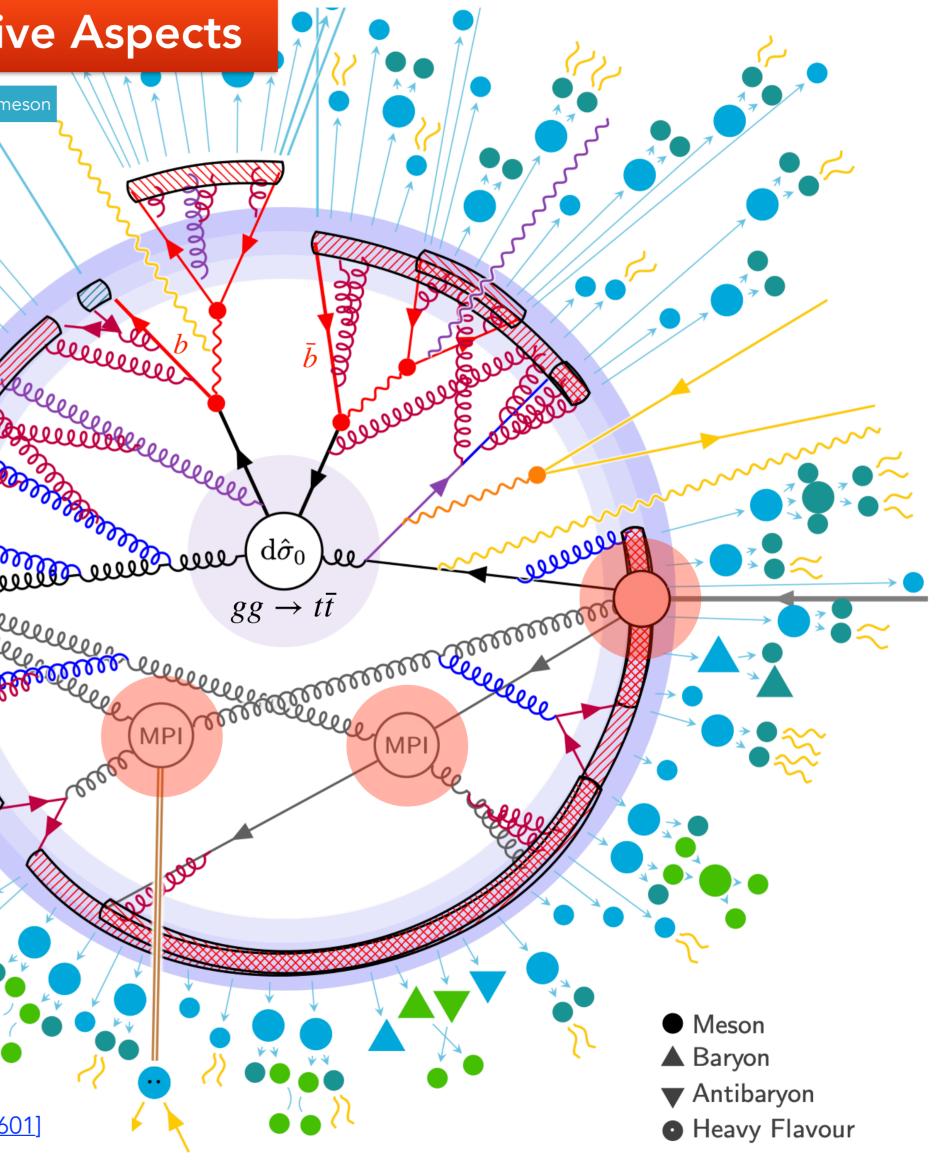

\* Already quite optimised: uses analytical MEs, "folds" phase space to cancel azimuthally antipodal points, and uses antenna subtraction ( $\rightarrow$  smaller # of NLO subtraction terms than Catani-Seymour or FKS).

### Back to Basics — Anatomy of (Linear) Confinement

# On lattice, compute potential energy of a colour-singlet $q\bar{q}$ state, as function of the distance, R, between the q and $\bar{q}$ :

#### 

29

### **String Fragmentation in One Slide**

#### The string model provides a mapping:

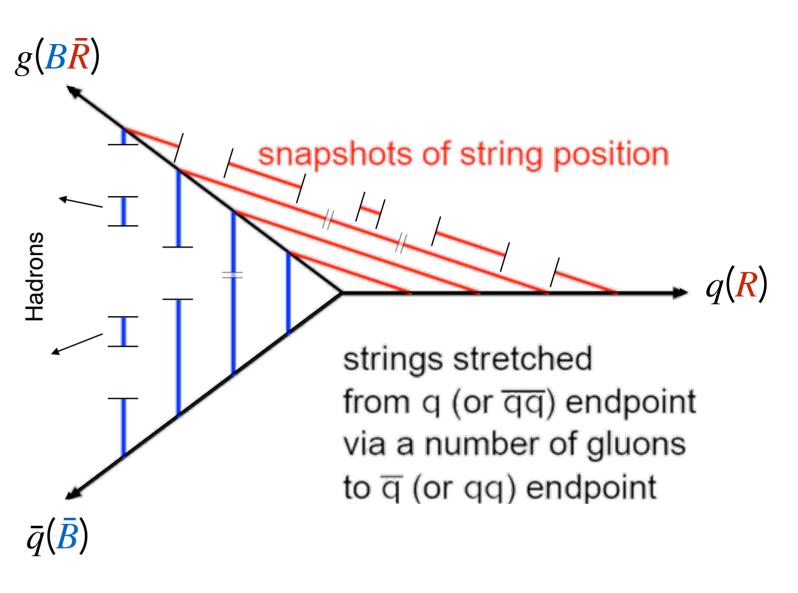

- Quarks > String endpoints
- Gluons > Kinks on strings
- Further evolution then governed by string world sheet (area law)

### + string breaks by tunnelling

By analogy with "Schwinger mechanism" in QED (electron-positron pair production in strong electric field)

#### Jets of Hadrons!

String breaks by quark pair production

 $\implies$  strangeness suppression

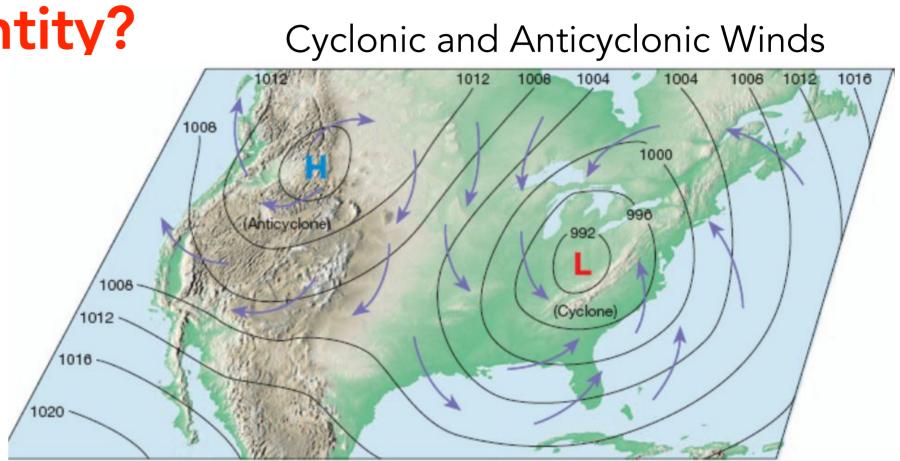

$$\propto \frac{\exp\left(\frac{-\pi m_s^2}{\kappa}\right)}{\exp\left(\frac{-\pi m_{u,d}^2}{\kappa}\right)}$$

## **Beyond the Static Limit**

**Regard tension** *k* as an emergent quantity? Not fundamental strings

#### May depend on (invariant) time $\tau$

E.g., hot strings which cool down Hunt-Smith & PZS 2020

#### May depend on spatial coordinate $\sigma$

Now working with E. Carragher & J. March-Russell (Oxford).

#### May depend on environment (e.g., other strings nearby)

Two approaches (so far) within Lund string-model context:

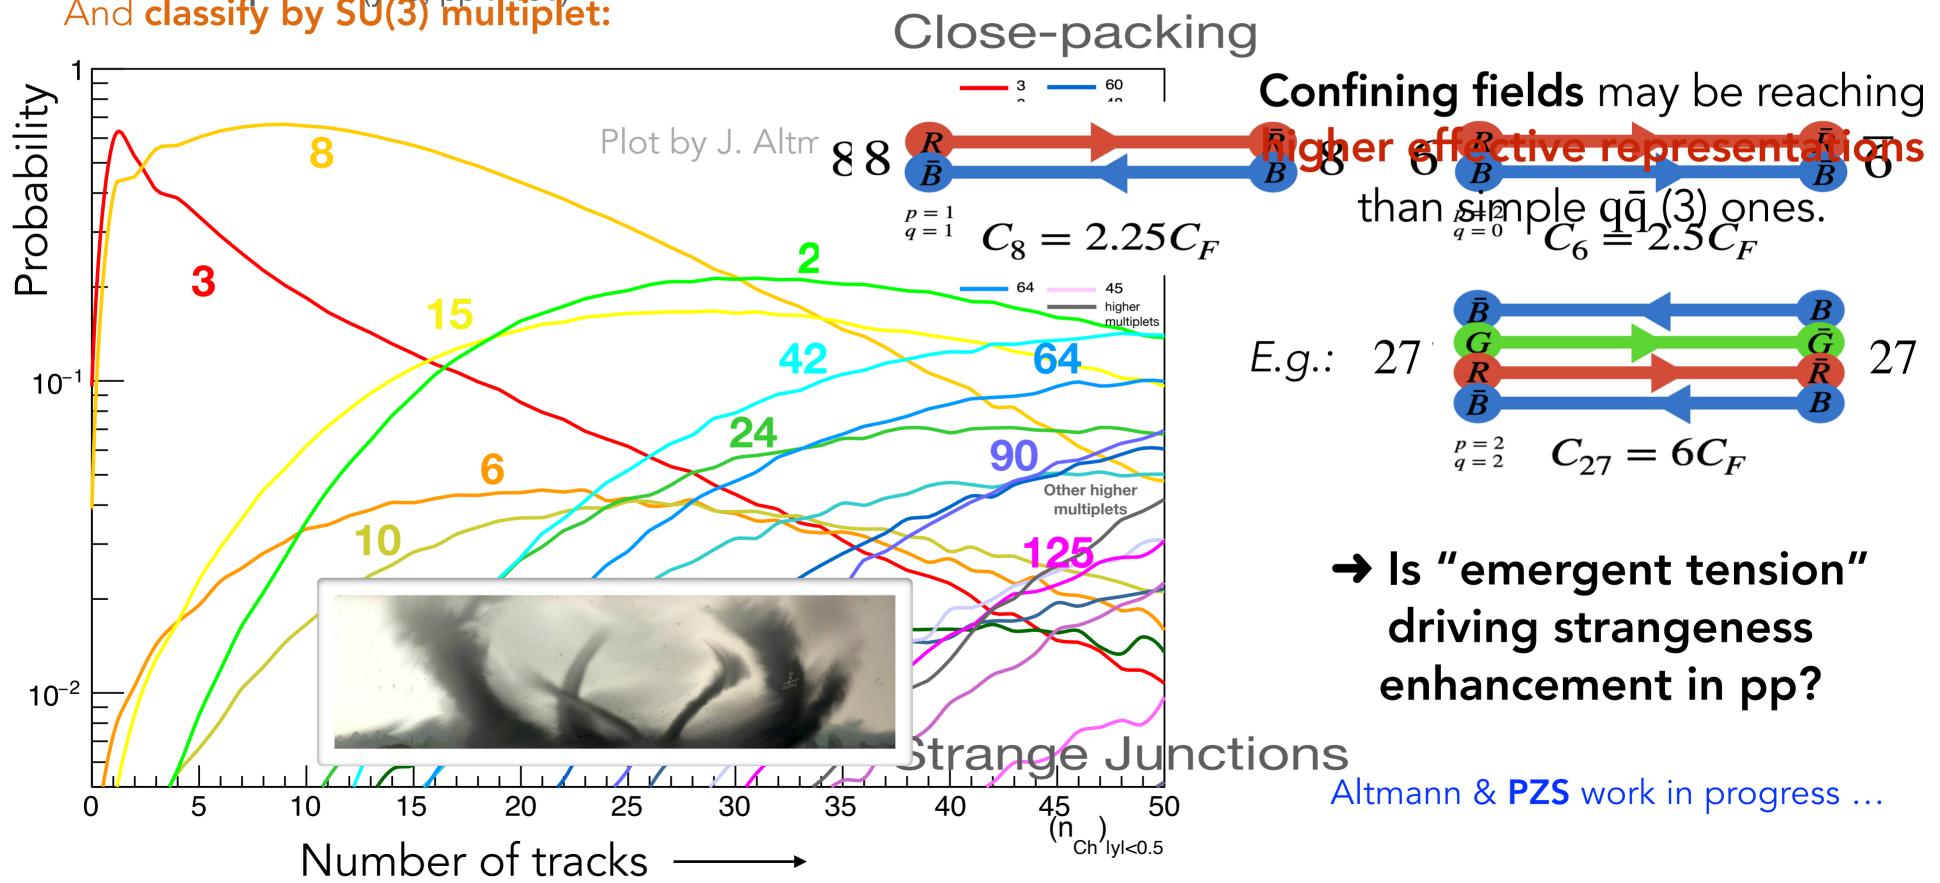

**Colour Ropes** [Bierlich et al. 2015; + more recent...]

Close-Packing [Fischer & Sjöstrand 2017; Altmann & PZS 2024]

# Non-Linear String Dynamics?

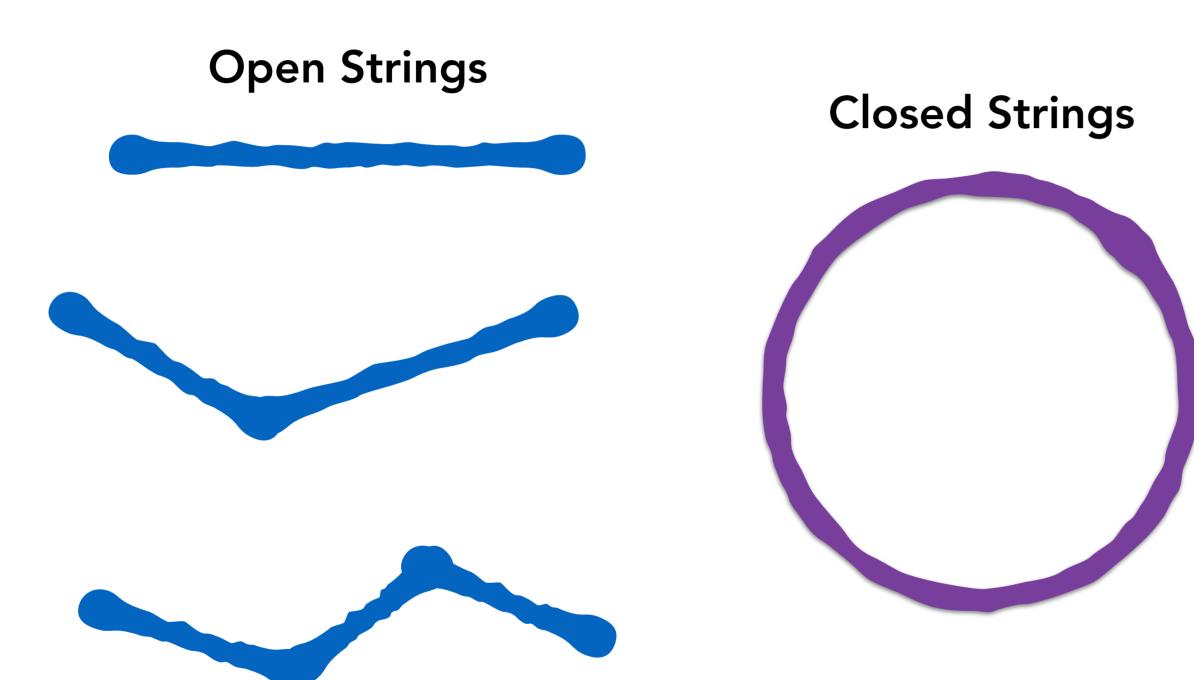

#### MPI $\implies$ lots of coloured partons scattered into the final states

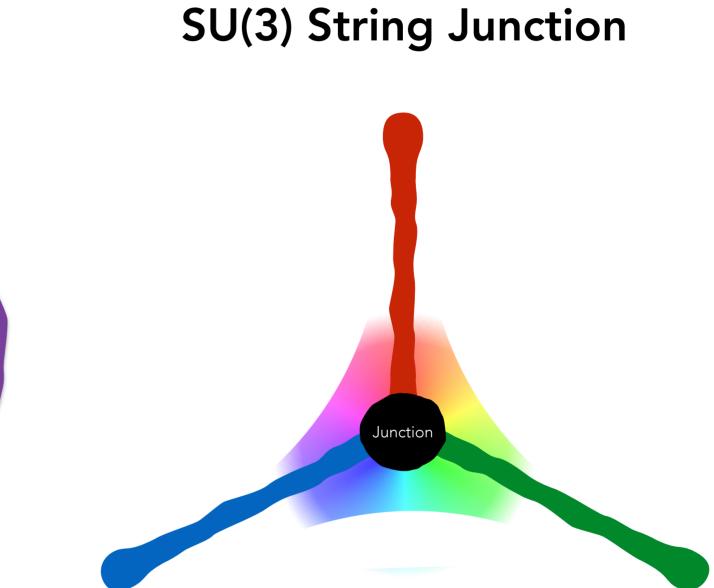

# Count **# of (oriented) flux lines** crossing y = 0 in pp collisions (according to PYTHIA) Multiplets (y=0, pp 7 TeV) And classify by SU(3) multiplet:

### What about Baryon Number?

Types of string topologies:

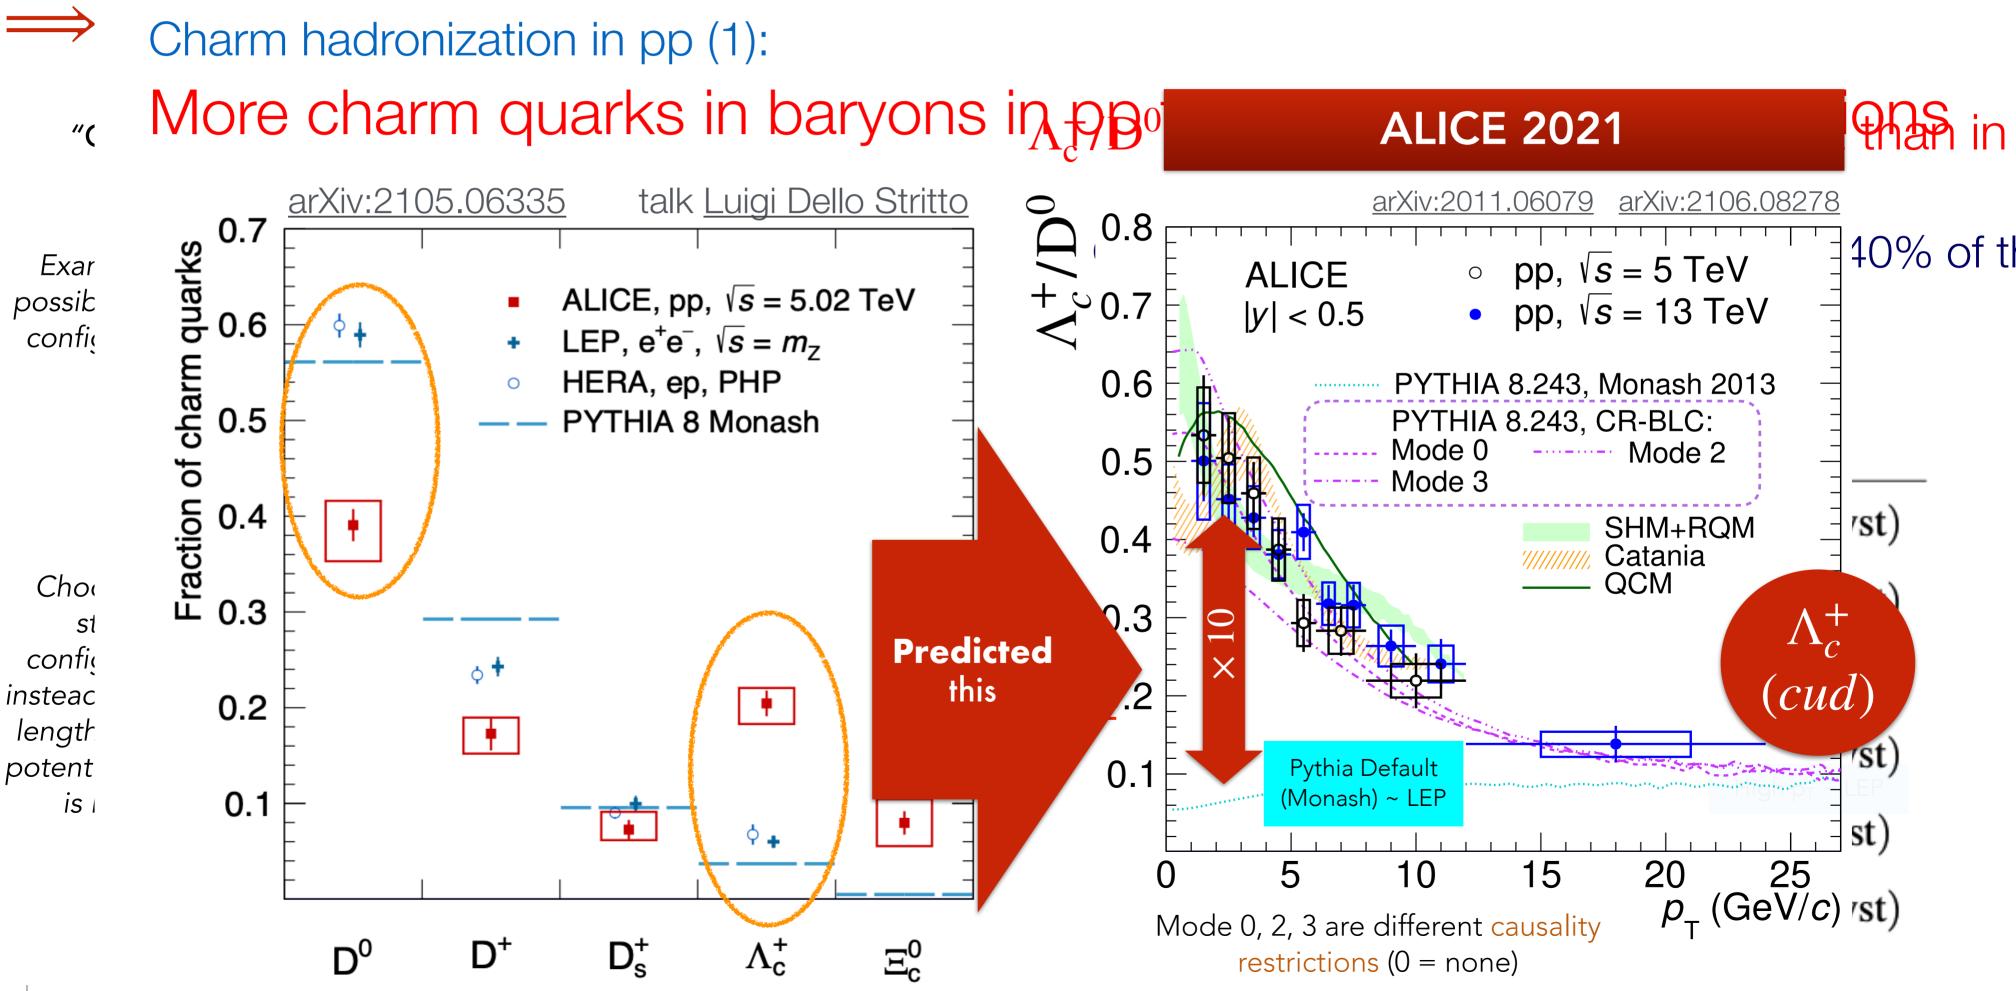

#### Could we get these at LHC?

String Formation Beyond Leading Colour Christiansen & PZS 2015

### **String Junctions at LHC ?**

#### Stochastic sampling of SU(3) group probabilities (e.g., $3 \otimes 3 = 6 \oplus \overline{3}$ )

**String Junctions Revisited** Altmann & **PZS** 2024 + collaborations with Warwick & Trieste

# Thank you
